[Adaptive Antenna Arrays - LMS Algorithm](#)
LMS stands for Least-Mean-Square. This algorithm was developed by Bernard Widrow in the 1960s, and is the first widely used adaptive algorithm. It is still widely used in adaptive digital signal processing and adaptive antenna arrays, primarily because of its simplicity, ease of implementation and good convergence properties.

Adaptive Antenna Systems B Abstract-A system consisting of an antenna array and an adaptive processor performing filtering in both the space and the frequency domains, thus reducing the sensitivity of the signal-receiving system to interfering directional wave sources. Variable weights of a signal processor can be automatically adjusted by a simple adaptive technique based on the least-mean

[Adaptive Array Antennas: Principles and Applications ...](#)
The course begins by reviewing the basics of antenna arrays and beamforming, establishing a firm context for the introduction of array-based adaptive algorithms. A simplified and practical explanation of the array covariance matrix with its eigenvalues and eigenvectors is presented, together with an understanding of their role in adaptive nulling. Classic covariance matrix-based approaches are
[Adaptive Antenna Arrays Using a Genetic Algorithm](#)
Adaptive antennas enhance desired signal reception by placing nulls in the antenna pattern in the directions of the interference while minimally perturbing the main beam.
[Smart antenna - Wikipedia](#)
Smart antennas (also known as adaptive array antennas, digital antenna arrays, multiple antennas and, recently, MIMO) are antenna arrays with smart signal processing

algorithms used to identify spatial signal signatures such as the direction of arrival (DOA) of the signal, and use them to calculate beamforming vectors which are used to track and locate the antenna beam on the mobile target.
