TABLE I CLASSIFICATION OF CONGENITAL SKELETAL LIMB DEFICIENCIES\* Hemimelia may be complete (when the entire distal half of a limb is absent) or partial ( when the greater portion of the distal half is absent ).

[Congenital Limb Deficiencies and Acquired Amputations in ...](#)

Lower-limb congenital deficiencies are evaluated to determine their ability to withstand the forces of weightbearing and walking and to assess the comparative lengths of each leg. Surgery may be necessary to modify the residual limb for a prosthesis so that it will tolerate weightbearing and walking.

[Congenital Limb Defects | Boston Children's Hospital](#) Congenital limb defects occur when a portion or the entire upper or lower limb fails to form normally when the baby is developing in the uterus. The most common congenital limb defects can include: complete or partial absence of the limb (such as fibula hemimelia or

[Congenital upper limb deficiency: A case report ...](#)

The limb deficiency disorders are a broad group of congenital anomalies featuring significant hypoplasia or aplasia of 1 or more bones of the limbs that can occur in isolation or associated with other anomalies. 3

#### **The Child with a Limb Deficiency | Musculoskeletal Key**

The incidence of all upper extremity amputations is not precisely known but is thought to be more than lower extremity amputations and more often congenital and bilateral than acquired (8, 9). The most common congenital upper extremity amputation is by far the transverse forearm (below-elbow) amputation, with radial longitudinal deficiency being the nextmost common.

#### **Congenital limb abnormalities: Causes, Symptoms and Diagnosis**

Congenital limb abnormalities are rare. These abnormalities can happen because of a chromosome problem, or in some cases, congenital limb abnormalities can result from a mother taking prescription

#### **Facts about Upper and Lower Limb Reduction Defects | CDC**

Upper and lower limb reduction defects occur when a part of or the entire arm (upper limb) or leg (lower limb) of a fetus fails to form completely during pregnancy. The defect is referred to as a limb reduction because a limb is reduced from its normal size or is missing.
