[Creep & Shrinkage Explained | The Structural World](#)

Creep When the concrete is loaded in compression, an elastic strain develops as shown in figure A. If this load remains on the member, creep strain developed with time. The main factors affecting creep strain are the concrete strength and mixture, the type of aggregate, curing, the relative humidity and the duration of the sustained loading.

[Theory of Creep and Shrinkage in 'Concrete Structures: A ...](#)

creep is linearly dependent on stress up to about 0.4 of the strength and obeys the principle of superposition, provided that large strain reversals (not stress reversals) and, especially, cyclic strains are "excluded" [3-5, 7].

[Creep and shrinkage of concrete - Wikipedia](#)

Creep and shrinkage of concrete are two physical properties of concrete. The creep of concrete, which originates from the calcium silicate hydrates (C-S-H) in the hardened Portland cement paste (which is the binder of mineral aggregates), is fundamentally different from the creep of metals and polymers.

[Creep and Shrinkage - help.civilfem.com](#)

Shrinkage is an unloaded time-dependent deformation, while creep is an under load time-dependent deformation. Although both concepts are two aspects of a single complex physical phenomenon, based on the rheological behavior of concrete, they should be considered as independent and studied separately.

The creep strains of Ref 0.36 are the lowest which is in accordance with the literature because higher strength decreases creep . Ref 0.36 and SAP 0.36 + 0.06 have

almost the same creep strains although strength and paste volume are different.

estimate creep and shrinkage strain in concrete, i.e. either Eurocode 2 or ACI 318. Eurocode 2 is based on the CEB-FIP MC 90 model recommended by the Euro-International Committee, and ACI 318 is based on the ACI 209 model recommended by the American Concrete Institute (Meyerson et al. 2002: 8). This chapter presents three shrinkage and creep predictions models, namely the CEB-FIP MC 90 model
