[Electrostatic nuclear accelerator - Wikipedia](#)

An electrostatic nuclear accelerator is one of the two main types of particle accelerators, where charged particles can be accelerated by subjection to a static high voltage potential. The static high voltage method is contrasted with the dynamic fields used in oscillating field particle accelerators.

[Electrostatic Particle Accelerator . Overview](#): This is a small electrostatic particle accelerator, built in my senior year of high school(2002-2003). It is designed for electron acceleration. Power is provided by a Van de Graaf generator or Cockroft Walton multiplier; electrons are transferred to the sphere until the charge becomes sufficient to ionize air and the charge jumps between the Electrostatic Van de Graaff electron accelerator.

[What Is a Particle Accelerator Used For? | Owlcation](#)

[Electrostatic accelerators](#) The first particle accelerators utilised a simple setup: a single, static high voltage was generated and then applied across a vacuum. The electric field generated from this voltage would then accelerate any charged particles along the tube, due to the electrostatic force.
