The scale of the fine structure splitting relative to the gross structure energies is on the order of  $(Z\alpha)^2$ , where  $Z$  is the atomic number and  $\alpha$  is the fine-structure constant, a dimensionless number equal to approximately 1/137. atomic physics - Where does the fine structure constant ...

The fine structure constant is one of the fundamental constants in nature, just like the speed of light or Planck's constant. It is there, and that's all we know for sure. We don't really have a compelling theory on its origin, nor a mechanism that explains its value.

Fine-structure constant - Wikipedia

In physics, the fine-structure constant, also known as Sommerfeld's constant, commonly denoted by (the Greek letter alpha), is a dimensionless physical constant characterizing the strength of the electromagnetic interaction between elementary charged particles. Fine structure | spectroscopy | Britannica.com

In fine structure (q.v.), line splitting is the result of energy changes produced by electron spin orbit coupling (i.e., interaction of forces from orbital and spin motion of electrons); but in hyperfine structure, line splitting is attributed to the fact that in addition to electron spin in Atiyah and the Fine-Structure Constant | Sean Carroll So what you and I measure as the fine-structure constant actually depends on things like the mass of the top quark and the coupling of the Higgs boson. Again, nowhere to be found in Atiyah's paper. Again, nowhere to be found in Atiyah's paper.

We begin a short series of discussions on "The Fine Structure Constant," one of the most mysterious quantities in physics. We start from the beginning and get progressively more sophisticated in

**Hydrogen Fine Structure - HyperPhysics Concepts**

Hydrogen Fine Structure When the familiar red spectral line of the hydrogen spectrum is examined at very high resolution, it is found to be a closely-spaced doublet. This splitting is called fine structure and was one of the first experimental evidences for electron spin.

The Fine Structure Constant is one of the most precise constants we have. It has a standard uncertainty of 0.23 parts per billion. That means we know it to the  $\alpha=0.0072973525664(17)$  But the value of the expression you mentioned is

**Exact Calculation of the Fine Structure Constant**

value for the reciprocal of the Fine Structure Constant was calculated using Equation 16. For non-primitive Pythagorean Triples the highest common factor was also calculated to detect if the Triple was a multiple of a previously calculated primitive.
