Fire Hazards of Exterior Wall Construction: A Research Report

These exterior wall assemblies include Exterior Insulation Finish Systems (EIFS), metal composite claddings, high-pressure laminates, and weather-resistive barriers (WRB). Given a number of documented fire incidents involving combustible exterior walls, a better understanding of these incidents was needed to inform current material test methods and potential fire mitigation strategies.

Many combustible materials are used today in commercial wall assemblies to improve energy performance, reduce water and air infiltration, and allow for aesthetic design flexibility. These assemblies include Exterior Insulation Finish Systems (EIFS or ETICS), metal composite claddings, high-pressure laminates, foam plastic in cavity walls, and water-resistive barriers (WRB). The combustibility of the assembly components directly impacts the fire hazard. For example, the insulation component
