The emphasis of "global" aspects of a geometric structure has been apparent in connection with the topological structure, once the notion of the differentiable manifold took the place THEORY OF CONNECTIONS AND HOLONOMY GROUPS of an ambiguous term like "space of  $x_1, \dots, x_n$ ." But even in the study of local aspects, many things have remained unclarified until very recently. In fact, one of the

For curved connections, holonomy has nontrivial local and global features. Any kind of connection on a manifold gives rise, through its parallel transport maps, to some notion of holonomy. The most common forms of holonomy are for connections possessing some kind of symmetry. Important examples include: holonomy of the Levi-Civita connection in Riemannian geometry, holonomy of connections in vector bundles, holonomy of Cartan connections, and holonomy of connections in principal bundles. tains the holonomy group of a given connection  $r$ , the geometric structure is  $r$ -parallel, [20, Propositions 5.6 and 7.4]. The most familiar example is the existence of a semi-Riemannian metric which is equivalent to a reduction of the structure group to  $O(n)$ . Metricity of the Levi-Civita connection implies that its holonomy group is contained in  $O(n)$ . Another classical example is a  $2n$
