Neural Development. Neural development is a highly regulated process and since molecules and proteins of the immune system are continually being found to participate in mechanisms of normal brain development, any immune overactivation, or failure of the immune system to activate will impact brain circuitry.

Shaping the neural tube. Early in central nervous system (CNS) development, the neural tube forms from the neural plate. This requires the coordination of many cellular processes, disruptions of which can result in spina bifida, the most common developmental disease affecting the spinal cord.

Neural development. The functionality of the nervous system relies on its correct development. Early stages of neural development are characterized by neuronal migration followed by extensive growth of axons and dendrites, and later growth by synapse formation and refinement of functional connections within a neuronal network.
