Mechanism. After being produced, the stability and distribution of the different transcripts is regulated (post-transcriptional regulation) by means of RNA binding protein (RBP) that control the various steps and rates of events such as alternative splicing, nuclear degradation (exosome), processing.

However, post-transcriptional regulation, including the processing, export, localization, turnover and translation of mRNAs (mRNAs), adds substantial complexity to the control of gene expression. The various steps in the pathway from DNA sequence to proteins seem to be connected and coordinated with each other 4, 5.
