Subpulmonic (outlet, supraeristal, infundibular, conal septal, doubly committed subarterial defects): These VSDs lie superior and anterior in the ventricular septum. These occur in about 5-7% of VSDs and are located immediately beneath the aortic and pulmonary valves (1,2). These rarely close spontaneously.

Right Coronary Cusp Prolapse Resembling Subpulmonic ...

Ventricular septal defect (VSD) can be associated with various complications such as aortic regurgitation (AR). AR in VSD come from a deficiency or hypoplasia of the conal septum which leads to abnormal apposition in diastole and prolapse of the poorly supported noncoronary or right coronary cusp through the VSD into the right ventricle resembling subpulmonic stenosis and subsequently results in distortion of the aortic valve and progressive AR. AR often increases in severity with age and it
