Communicated by Prof. J. H. Horlock SUMMARY The measurement of the turbulence intensity in three wind tunnels and a research compressor is described and the minimum values are found to be 0.401% for the No. 1 tunnel, 0.256% for the No. 2 tunnel, 0

Introduction to Turbulent Flow

Introduction to Turbulent Flow Turbulent Flow. In turbulent flow, the velocity components and other variables (e.g. pressure, density - if the fluid is compressible, temperature - if the temperature is not uniform) at a point fluctuate with time in an apparently random fashion. In general, turbulent flow is time-dependent, rotational, and three dimensional thus, methods such as developed

Turbulence - Wikipedia

A turbulent event is a series of turbulent fluctuations that contain more energy than the average flow turbulence. [6] [7] The turbulent events are associated with coherent flow structures such as eddies and turbulent bursting, and they play a critical role in terms of sediment scour, accretion and transport in rivers as well as contaminant mixing and dispersion in rivers and estuaries, and in
