The quadratic assignment problem (QAP) was introduced by Koopmans and Beckman in 1957 in the context of locating "indivisible economic activities". The objective of the problem is to assign a set of facilities to a set of locations in such a way as to minimize the total assignment cost. The assignment cost for a pair of facilities is a function of the flow between the facilities and the [\(PDF\) The Quadratic Assignment Problem: A Note](#) In this study, to cope with the node visitation order, we first explore a representation for the TSPPP grounded on the Quadratic Assignment Problem (QAP) in Koopmans and Beckmann [18, 19].

is the quadratic assignment problem, which is known to be NP-hard. Due to its generality and exibility, this formulation and its extensions has been favored in recent graph matching research [6,7,10,18,20,24,31,32]. 2.2.
