A lot of people come to SpaceWeatherLive to follow the Sun's activity or if there is aurora to be seen, but with more traffic comes higher server costs.

[Current Solar Activity Cycle Is Weakest In a Century | Space](#)

SAN FRANCISCO The sun's current space-weather cycle is the most anemic in 100 years, scientists say. Our star is now at "solar maximum," the peak phase of its 11-year activity cycle.

[Solar cycle - Wikipedia](#)

The solar cycle or solar magnetic activity cycle is the nearly periodic 11-year change in the Sun's activity (including changes in the levels of solar radiation and ejection of solar material) and appearance (changes in the number and size of sunspots, flares, and other manifestations).

[Solar Activity - The Sun Today with C. Alex Young, Ph.D.](#)

Every solar cycle, the number of sunspots, flares, and solar storms increases to a peak, which is known as the solar maximum. Then, after a few years of high activity, the Sun will ramp down to a few years of low activity, known as the solar minimum.

[Diminishing solar activity may bring new Ice Age by 2030 ...](#)

In 17th century, though, there was a prolonged reduction in solar activity called the Maunder minimum, which lasted roughly from 1645 to 1700. During this period, there were only about 50 sunspots instead of the usual 40-50 thousand sunspots. Analysis of solar radiation showed that its maxima and minima almost coincide with the maxima and minima in the number of spots.

[Solar Cycle Primer | NASA](#)

The number of sunspots on the sun increase and decrease over time in a regular, approximately 11-year cycle. More sunspots mean increased solar activity, when great blooms of radiation and particles blast off the sun.

[How the Sun's 11-Year Solar Cycle Works](#)

An extremely long stretch of subdued activity in recent years puzzled astronomers, and many solar physicists are working on developing better forecasting models of the solar cycle.

[Solar Minimum is Coming | Science Mission Directorate](#)

Solar activity simply changes form. For instance, says Pesnell, during solar minimum we can see the development of long-lived coronal holes. Coronal holes

are vast regions in the sun's atmosphere where the sun's magnetic field opens up and allows streams of solar particles to escape the sun as the fast solar wind.

The recent Solar Cycle is represented in several ways. At the top is the Sunspot Number, in the middle, the F10.7cm Radio Flux, and at the bottom, the A_p Index (a measure of geomagnetic activity) history.

[Solar cycle 24 - Wikipedia](#)

Solar Cycle 24 is the 24th solar cycle since 1755, when extensive recording of solar sunspot activity began. [1] [2]

It is the current solar cycle, and began in December 2008 with a smoothed minimum of 2.2 (SIDC formula).
