The quiet chromosphere Chromosphere . Simplified sketch of the QUIET photosphere and chromosphere

Wedemeyer-B hm et al. 2008: similar to an earlier sketch by Rob Rutten . What is special about the chromosphere? Possibly Sun's most complex layer: waves, gas (thermal energy), flows, magnetic field all have similar energy densities. Radiation needs non-LTE RT treatment, non-equilibrium

Abstract. The quiet Sun is not quiet in the sense that it is free of all disturbance; over the whole surface the fine structures (granulation, spicules) are continuously changing, waves and oscillations occur and large-scale patterns (supergranulation, chromospheric network) evolve.

The cool component has temperatures as low as 3000 to 3500 kelvin and appears to cover 50 to 85 percent of the quiet solar surface. There is a steep temperature rise to normal chromospheric
