All phased array transducer systems direct ultrasound pulses in many directions to create a two dimensional image. (True or False) Three-Dimensional real time imaging. These transducers steer the beam with a motor and focus the beam with an acoustic lens or a curved PZT element. Mechanical transducers. These transducer systems typically produce an image that, throughout its entire depth

A new two-dimensional, real-time, high resolution ultrasound imaging system is described. This system uses

a linear array of ultrasound transducers to generate tomographic images of the heart in a circular sector format.

## REAL TIME TWO DIMENSIONAL ULTRASOUND IMAGING

**INTRODUCTION.** In recent years the field of diagnostic ultrasound imaging has undergone rapid evolution. One significant technological advance has been the development of phased linear array sector scanners which permit real time visualization of dynamic structures within the body such as the heart.

**Abstract:** Phased array ultrasound transducers have been fabricated in our laboratories at Duke University since 1970. In 1986, we began the development of 2-D arrays with a 20 /spl times/ 20 element Mills cross array including 64 active channels operating at 1 MHz which produced the first real time 3-D ultrasound images.

Current ultrasound methods to detect and assess the severity of carotid stenoses are based either on imaging, Doppler signal analysis, or a combination of the two. Of the imaging methods, three modalities can be identified: B-mode, pulsed Doppler, and continuous wave (CW) Doppler. The limitations of each method may be partially overcome either by using combinations of the imaging modalities or
